**Systematic title based on use descriptor**

SU: Not relevant
PC: PC 7: Base metals and alloys
AC: AC 7 – Metal articles

ERC: ERC 3: Formulation in materials
ERC 10a: Wide dispersive outdoor use of long-life articles and materials with low release
ERC 11a: Wide dispersive indoor use of long-life articles and materials with low release
ERC 12a: Industrial processing of articles with abrasive techniques (low release)
ERC 12b: Industrial processing of articles with abrasive techniques (high release)

PROC: PROC 4: Use in a batch and other process where opportunity for exposure arises
PROC 8b: Transfer of substance or preparation from/to vessels/large containers at dedicated facilities
PROC 22: Potentially closed processing operations with minerals/metals at elevated temperature
PROC 21: Low energy manipulation of substances bound in materials and/or articles
PROC 23: Open processing and transfer operations with metals at elevated temperature
PROC 24: High (mechanical) energy work-up of substance bound in materials
PROC 25: Other hot work operations with metals
PROC 0: Cleaning and maintenance

**Processes, tasks, activities covered (environment)**

Stainless, special steels and special alloys manufacturing (S4A)

**Processes, tasks, activities covered (workers)**

Contributing exposure scenario ES 9.1:
PROC 8b: Raw material handling

Contributing exposure scenario ES 9.2:
PROC4, PROC 22, PROC 23: First processing

Contributing exposure scenario ES 9.3:
PROC 24: Further processing

Contributing exposure scenario ES 9.4:
PROC 24, PROC 25: Finishing

Contributing exposure scenario ES 9.5:
PROC 0: Cleaning and maintenance

Contributing exposure scenario ES 9.6:
PROC 21: Packaging, shipping and storage

2. Operational conditions and risk management measures

2.1 Control of environmental exposure

Environmental related free short title
Stainless, special steels and special alloys manufacturing (S4A)

**Systematic title based on use descriptor (environment)**

ERC 3: Formulation in materials
ERC 10a: Wide dispersive outdoor use of long-life articles and materials with low release
ERC 11a: Wide dispersive indoor use of long-life articles and materials with low release
ERC 12a: Industrial processing of articles with abrasive techniques (low release)
ERC 12b: Industrial processing of articles with abrasive techniques (high release)

**Processes, tasks, activities covered (environment)**

Stainless, special steels and special alloys manufacturing (S4A)

**Environmental Assessment Method**
Estimates based on monitoring local and regional concentrations are used

For the use of Vale's downstream customers only
For the use of Vale's downstream customers only

### Product characteristics
Ni metal is used in the form of Ni briquettes, Ni plates, shots or ingots, part of steel or alloys scrap, FeNi (ingots and granules) and nickel sinter oxide.

### Amounts used

**Maximum daily use at a site**
- ES 1: 4.2 tonnes/day (median 50\(^\text{th}\) % emission days, 25\(^\text{th}\) % tonnage)
- ES 2: 38 tonnes/day (median 50\(^\text{th}\) % emission days, 50\(^\text{th}\) % tonnage)
- ES 3: 152 tonnes/day (median 50\(^\text{th}\) % emission days, 90\(^\text{th}\) % tonnage)
- ES 4: 152 tonnes/day (median 50\(^\text{th}\) % emission days, 90\(^\text{th}\) % tonnage)

**Maximum annual use at a site**
- ES 1: 1520 tonnes (25\(^\text{th}\) %, 2007)
- ES 2: 14000 tonnes (50\(^\text{th}\) %, 2007)
- ES 3: 55300 tonnes (90\(^\text{th}\) %, 2007)
- ES 4: 55,300 tonnes (90\(^\text{th}\) %, 2007)

### Frequency and duration of use

**Pattern of release to the environment**
365 days per year per site (median 50\(^\text{th}\) %)

### Environment factors not influenced by risk management

**Receiving surface water flow rate**
- ES 1: 18,000 m\(^3\)/d (Effluent Site: 2000 m\(^3\)/d)
- ES 2: 198,000 m\(^3\)/d (Effluent Site: 2000 m\(^3\)/d)
- ES 3: 1998,000 m\(^3\)/d (Effluent Site: 2000 m\(^3\)/d)

**Dilution capacity, freshwater**
- ES 1: 10 (default)
- ES 2: 100
- ES 3: 1000

**Dilution capacity, marine**
100 (default)

### Other given operational conditions affecting environmental exposure
None

### Technical conditions and measures at process level (source) to prevent release
None

### Technical onsite conditions and measures to reduce or limit discharges, air emissions and releases to soil

#### Waste water:
On-site waste water treatment in a physico-chemical treatment plant by chemical precipitation, sedimentation, filtration, oiling removal or a combination of these methods.

**Release factor after on-site treatment to freshwater:**
- ES 1: Release factor after on-site treatment: 13.80 g/T (90\(^\text{th}\) %, RAR dataset)
- ES 2: Release factor after on-site treatment: 13.80 g/T (90\(^\text{th}\) %, RAR dataset)
- ES 3: Release factor after on-site treatment: 13.80 g/T (90\(^\text{th}\) %, RAR dataset)
- ES 4: Release factor after on-site treatment to marine water: 7.25 g/T (75\(^\text{th}\) %, RAR dataset)

#### Air:
Treatment of stack air emission by fabric or bag filters, or wet scrubbers. (Efficiency min. 99%) 

**Release factor after on-site treatment:** 136.8 g/T (90\(^\text{th}\) %, RAR dataset)

### Organizational measures to prevent/limit release from site
None

### Conditions and measures related to municipal sewage treatment plant
None

### Discharge rate of the Municipal STP
Not relevant

### Incineration of the sludge of the Municipal STP
Not relevant

### Conditions and measures related to external treatment of waste for disposal
Hazardous wastes from onsite risk management measures and solid or liquid wastes from production, use and cleaning processes should be disposed of separately to hazardous waste incineration plants or hazardous waste landfills as hazardous waste. Releases to the floor, water and soil are to be prevented. If the nickel content of the waste is elevated enough, internal or external recovery/recycling might be considered.

**Fraction of daily/annual use expected in waste:**
- Nickel producers = 0.05%
- DU: stainless steel and alloy steels = 0.6%
- DU: nickel alloys, copper alloys, foundry, batteries, catalysts, chemicals, dyes and others = 0.5%
- DU: Plating = 3%
### Appropriate waste codes:

01 03 07*, 02 01 10*, 06 03 13*, 06 03 15*, 06 04 05*, 06 05 02*, 10 08 04, 10 08 08*, 10 08 09, 10 08 15*, 10 08 16, 10 10 03, 10 10 05*, 10 10 07*, 10 10 09*, 10 10 10, 10 10 11*, 11 02 07*, 12 01 03*, 12 01 04, 15 01 04*, 15 01 10*, 15 01 10*, 16 01 04*, 16 01 06*, 16 01 08*, 16 06 02*, 16 06 05, 16 08 02*, 16 08 03*, 17 04 07*, 17 04 09*, 19 09 04*, 19 10 02*, 19 12 03*

### Suitable disposal:

Keep separate and dispose of to either:

- Hazardous landfill operated under Directive 1999/31/EC.

### Conditions and measures related to external recovery of waste

Shredders pre-treating metal wastes should have a maximum release factors to air of 0.0015 after RMM and no releases to water and soil.

\[ Q_{\text{max, local(shredding)}} = 26 \text{ kg Ni/day} \]

(Note: This Qmax, local for shredders is based on the existing information at the moment of the update. It will be reviewed when new information is available from the BREF for shredding)

### 2.2 Control of workers exposure for contributing exposure scenario ES 9.1

**Raw material handling**

**Workers related free short title**

Stainless, special steels and special alloys manufacturing (S4A)

**Use descriptor covered**

PROC 8b: Transfer of substance or preparation from / to vessels/large containers at dedicated facilities

**Processes, tasks, activities covered**

Raw material handling including unloading, transferring, storage and furnace charge

**Assessment Method**

Estimation of exposure based on measured data.

**Product characteristic**

Ni metal is used in the form of Ni briquettes, Ni plates, shots or ingots, part of steel or alloys scrap and FeNi (ingots and granules) and nickel sinter oxide

**Amounts used**

Not relevant

**Frequency and duration of use/exposure**

8 hour shifts. Exposure occurs in the process area for one third of the working day (160 minutes). The remaining time is spent in control room or pressure ventilated cabins.

**Human factors not influenced by risk management**

Respiration volume under conditions of use Not relevant

Room size and ventilation rate Not relevant

Area of skin contact with the substance under conditions of use Not relevant

Body weight Not relevant

**Other given operational conditions affecting workers exposure**

Work is taken place outdoor.

Oral: Good workplace hygiene practice

**Technical conditions and measures at process level (source) to prevent release**

None

**Technical conditions and measures to control dispersion from source towards the worker**

None

**Organisational measures to prevent /limit releases, dispersion and exposure**

None

**Conditions and measures related to personal protection, hygiene and health evaluation**

Gloves are required for hand protection, coveralls and eye protection is required when handling dusty materials.

### 2.3 Control of workers exposure for contributing exposure scenario ES 9.2

**First processing**

**Workers related free short title**

Stainless, special steels and special alloys manufacturing (S4A)

**Use descriptor covered**

PROC 4: Use in a batch and other process where opportunity for exposure arises
| PROC 22: Potentially closed processing operations with metals at elevated temperature  |
| PROC 23: Open processing and transfer operations with metals at elevated temperature |

**Processes, tasks, activities covered**
- First processing including melting (EAF, VIM, BOF, induction furnace), decarburisation (AOD, VOD), secondary metallurgical processes ESR and VAR, and casting

**Assessment Method**
- Estimation of exposure based on measured data and a Tier 1 model

**Product characteristic**
- Ni metal is used in the form of Ni briquettes, Ni plates, shots or ingots, part of steel or alloys scrap and FeNi (ingots and granules) and nickel sinter oxide.
- Ni metal is used in the form of molten metal charge when fed to the AOD, VOD, VIM, VAR or ESR and in the form of liquid or molten steel for casting.

**Amounts used**
- Not relevant

**Frequency and duration of use/exposure**
- 8 hour shifts. Exposure occurs in the process area for one third of the working day (160 minutes). The remaining time is spent in control room or pressure ventilated cabins.
- Duration of task maximum 4 hours

**Human factors not influenced by risk management**
- Not relevant

**Room size and ventilation rate**
- Not relevant

**Area of skin contact with the substance under conditions of use**
- 1980 cm²

**Body weight**
- Not relevant

**Other given operational conditions affecting workers exposure**
- Oral: Good workplace hygiene practice

**Technical conditions and measures at process level (source) to prevent release**
- During charging and tapping the system is open, while in use the converters are considered as a closed system.

**Technical conditions and measures to control dispersion from source towards the worker**
- General ventilation and LEV systems are required for steelmaking and casting and in dusty areas or when handling dusty materials.
- When adding alloying elements LEV system is required.

**Organisational measures to prevent/limit releases, dispersion and exposure**
- None

**Conditions and measures related to personal protection, hygiene and health evaluation**
- Gloves are required for hand protection, coveralls and eye protection is required when handling dusty materials.
- Steelmaking and casting: Gloves and coveralls suitable for handling hot metal are required. Eye/face protection against heat and splashing of hot metal is required.

### 2.4 Control of workers exposure for contributing exposure scenario ES 9.3

**Further processing**
- **Workers related free short title**: Stainless, special steels and special alloys manufacturing (S4A)
- **Use descriptor covered**: PROC 24: High (mechanical) energy work-up of substance bound in materials
- **Processes, tasks, activities covered**: Further processing including hot and cold rolling, forging, die-forging, grinding, and welding
- **Assessment Method**: Estimation of exposure based on measured data and a Tier 1 model

**Product characteristic**
- After casting Ni metal is incorporated in a chemical matrix such as massive stainless steel

**Amounts used**
- Not relevant

**Frequency and duration of use/exposure**
- 8 hour shifts. Exposure occurs in the process area for one third of the working day (160 minutes). The remaining time is spent in control room or pressure ventilated cabins.
- Duration of task maximum 4 hours

**Human factors not influenced by risk management**
- Not relevant

**Respiration volume under conditions of use**
- Not relevant

**Room size and ventilation rate**
- Not relevant
For the use of Vale's downstream customers only

Area of skin contact with the substance under conditions of use: 1980 cm²

Body weight: Not relevant

Other given operational conditions affecting workers' exposure

Oral: Good workplace hygiene practice

Technical conditions and measures at process level (source) to prevent release

None

Technical conditions and measures to control dispersion from source towards the worker

General ventilation is required for hot and cold rolling.

Organisational measures to prevent/limit releases, dispersion and exposure

None

Conditions and measures related to personal protection, hygiene and health evaluation

Hot rolling: Gloves and coveralls suitable for handling hot surfaces are required. Eye/face protection is required against heat.

Cold rolling: Gloves and overalls suitable for handling metal are required.

2.5 Control of workers' exposure for contributing exposure scenario ES 9.4

Finishing

Workers related free short title: Stainless, special steels and special alloys manufacturing (S4A)

Use descriptor covered: PROC24: High (mechanical) energy work-up of substance bound in materials

PROC 25: Other hot operations with metals

Processes, tasks, activities covered: Finishing including annealing, pickling, grinding and welding

Assessment Method: Estimation of exposure based on measured data and a Tier 1 model

Product characteristic

After casting and further processing Ni metal is incorporated in a chemical matrix such as massive stainless steel.

Amounts used:

Not relevant

Frequency and duration of use/exposure:

8 hour shifts. Exposure occurs in the process area for one third of the working day (160 minutes). The remaining time is spent in control room or pressure ventilated cabins.

Duration of task maximum 4 hours

Human factors not influenced by risk management

Respiration volume under conditions of use: Not relevant

Room size and ventilation rate: Not relevant

Area of skin contact with the substance under conditions of use: 1980 cm²

Body weight: Not relevant

Other given operational conditions affecting workers' exposure

Oral: Good workplace hygiene practice

Technical conditions and measures at process level (source) to prevent release

None

Technical conditions and measures to control dispersion from source towards the worker

General ventilation is required.

Organisational measures to prevent/limit releases, dispersion and exposure

None

Conditions and measures related to personal protection, hygiene and health evaluation

Annealing and pickling: Gloves and coveralls suitable for handling hot surfaces and pickling media are required. Eye/face protection against heat and pickling media is required.

Welding and grinding: Eye/face protection when welding and grinding is required. For manual welding and grinding respiration protection – Air purifying full mask (for example APF 10) is required.

2.6 Control of workers' exposure for contributing exposure scenario ES 9.5

Cleaning and maintenance

Workers related free short title: Stainless, special steels and special alloys manufacturing (S4A)

Use descriptor covered: PROC 0 – cleaning and maintenance

Processes, tasks, activities covered: Cleaning and maintenance

Assessment Method: Estimation of exposure based on measured data

Product characteristic

Ni metal is in the form of dust, pickling residues, incorporated in a chemical matrix such as massive stainless steel or in an

| Long-term systemic and local | mgNi/m³ | 0.05 | 0.03 | 0.6 | Exposure estimated using MEASE, a tier 1 model for PROC 21 for a massive object, >25% composition, and industrial use <240 min assumed. |

NR: Not Relevant

Acute local inhalation
DNEL based on respirable size aerosols. Equivalent inhalable fraction levels expected to be at least 3-fold higher

### 4. Guidance to DU to evaluate whether he works inside the boundaries set by the ES

**Environment**

Scaling of the release to air and water environment includes:
Refining of the release factor to air and waste water and/or and the efficiency of the air filter and wastewater treatment facility.
For the use of Vale’s downstream customers only

Scaling of the PNEC for aquatic environment by using a tiered approach for correction for bioavailability and background concentration ($C_{\text{local}}$ approach).

Scaling of the PNEC for soil compartment by using a tiered approach for correction for bioavailability and background concentration ($C_{\text{local}}$ approach).

**Workers**

Scaling considering duration and frequency of use

Collect process monitoring data with an inhalable sampler. The simultaneous use of a respirable sampler is encouraged. Use aerosol particle size information, when available, to confirm the appropriate use of the inhalable DNEL of 0.05 mg Ni/m$^3$. Respirable fraction exposure levels should be kept below 0.01 mg Ni/m$^3$.

For further information and guidance on exposure scenarios, available tools, and scaling options, please visit the Nickel Consortia exposure scenario library at the following link: [http://www.nickelconsortia.eu/exposure-scenario-library.html](http://www.nickelconsortia.eu/exposure-scenario-library.html)

**Man via Environment exposure and risk characterisation assessments for stainless, special steel and special alloys manufacturing (S4A)**

Inhalation is the critical exposure pathway for humans via the environment. The PEC for air at site neighbouring residential areas should be lower than the chronic inhalation DNEL for the general public of 20 ng Ni/m$^3$ as annual average in PM$_{10}$ in order to demonstrate adequate control of risk (RCR < 1) for Man via the Environment (MvE).

Here to a Generic safe use Exposure Scenario for MvE was developed based on the EUSES model. The MvE GES is defined as the product of tonnage ($T$) and emission factor to air ($EF$) being lower than 18000 g Ni/year. The value of 18000 g Ni/year is derived by using EUSES model to back-calculate the product of $T$ and $EF$ that results in a local air concentration ($C_{\text{local}}$) of 15.5 ng Ni/m$^3$. The value of 15.5 is derived from the difference between the DNEL of 20 ng Ni/m$^3$ and the EU regional background concentration ($C_{\text{regional}}$) of 4.5 ng Ni/m$^3$ (P90 annual concentration for 2012).

**Generic safe use ES for all sectors according to Tier 1 (EUSES model)**

<table>

</tbody>
</table>

*: EU average of country P90 annual Ni concentrations (2012)

If a site is not compliant with these conditions, meaning that the product of tonnage and emission factor is above 18000 g Ni/year, a tiered approach including site-specific modelling can be applied to demonstrate safe use.
